

Workshop FarFish on Small pelagic and climate change in the CECAF area

Links between the environment and population dynamics model outputs: The case of Anchovy in Gulf of Cádiz and first steps with chub mackerel in Morocco.

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 727891.

1.

A CHALLENGE FOR STOCK ASSESSMENT MODELLERS

Stock assessment models for an ecosystem-based fisheries management

Take home message

A methodology on how to use stock assessment model outputs to determine environmental drivers.

Engraulis encrasicolus

Gulf of Cádiz

Scomber colias

Moroccan Atlantic coast

WORK IN
PROGRESS

2.

ANCHOVY FISHERY IN THE GULF OF CADIZ

The Gulf of Cádiz

Engraulis encrasicolus

3.646.276,35 EUR in the first quarter of 2016, is the most important fishery in the region representing 10% of the Andalusian commercial landings

Environmentally-based recruitment

<https://youtu.be/xNiTda6FQfM>

Ecosystem
based
fisheries
management
EBFM

The approach

Expand an integrated model to incorporate the ecosystem approach

Model implementation

Model implementation

Integrated model

A model that includes a lot of information, i.e:

- ▷ Abundance indexes from surveys, age-length composition
- ▷ Spawner-recruit relationships
- ▷ CPUE and effort
- ▷ Direct estimates of abundance from mark-recapture or line transect methods.

GREAT ADVANTAGE: Consistency
“The inclusion of auxiliary information along with catch-age data allows for unbiased estimation” (Quinn 2003)

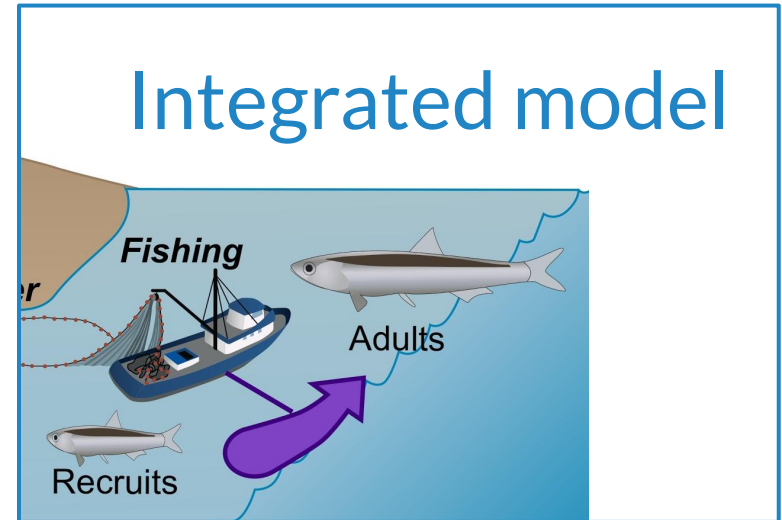

Model implementation

Integrated model

A model that includes a lot of information, i.e:

- ▷ Survey abundance, age-length composition,
- ▷ Spawner-recruit relationships
- ▷ CPUE and effort
- ▷ Direct estimates of abundance from mark-recapture or line transect methods.

GREAT ADVANTAGE: Consistency
“The inclusion of auxiliary information along with catch-age data allows for unbiased estimation” (Quinn 2003)

Examples:

- SS3
- Gadget
- CAGEAN
- ADAPT

Model implementation

Model implementation

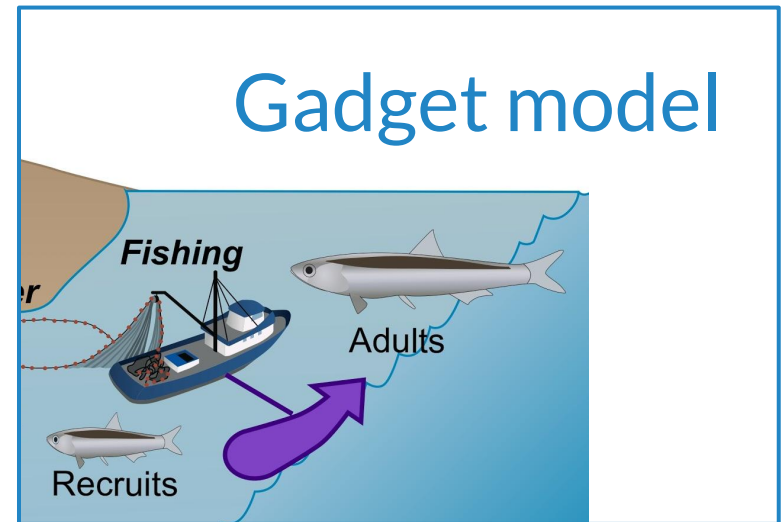

Gadget

A parametric, age-length-structured model. For this implementation we used:

- ▷ Landings from 1988 (Numbers, Age and length distributions)
- ▷ 3 Acoustic Surveys (Numbers, Age and length distributions)

ADVANTAGES:

- It is the model used as the basis of the assessment in ICES WGHANSA
- Data input and data output automated in R (data.frames, mfdb and Rgadget packages)
- Multiarea and multispecies

CAVEATS:

- Very complex
- Need specialized training and lot of time

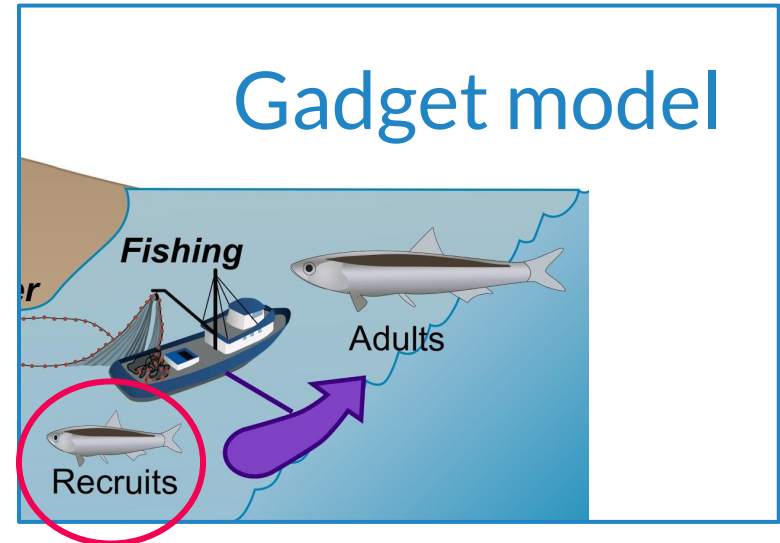

Model implementation

Gadget

A parametric,
age-length-structured model.
For this implementation we
used:

- ▷ Landings from 1988
(Numbers, Age and
length distributions)
- ▷ 3 Acoustic Surveys
(Numbers, Age and
length distributions)

Simulation and
log-likelihood
optimization

Granger-causality

Provides a framework that uses predictability to identify causation between time-series variables, provides a mathematical relationship between population dynamics and environmental covariates

Granger-causality

Granger-causality concept says that an stationary time-series variable X is said to "Granger-cause" (Granger, 1969) the stationary time-series variable Y , if past values of X help to predict the current value of Y better than just the past values of Y do.

$$Y_t = a + \alpha_1 Y_{t-1} + \cdots + \alpha_L Y_{t-L} + \beta_1 X_{t-1} + \cdots + \beta_L X_{t-L} + \epsilon_t$$

Test

$$H_A : \beta_i \neq 0$$

Granger-causality

Granger-causality concept says that an stationary time-series variable X is said to "Granger-cause" (Granger, 1969) the stationary time-series variable Y , if past values of X help to predict the current value of Y better than just the past values of Y do.

$$Y_t = a + \alpha_1 Y_{t-1} + \cdots + \alpha_L Y_{t-L} + \beta_1 X_{t-1} + \cdots + \beta_L X_{t-L} + \epsilon_t$$

Test

$$H_A : \beta_i \neq 0$$

WARNING: A well specified model is needed: No serial autocorrelation, no roots outside the unit circle

Recruitment-environmental factor relationship

$$R_t = a + \alpha_1 R_{t-1} + \cdots + \alpha_L R_{t-L} + \beta_1 W_{t-1} + \cdots + \beta_L W_{t-L} + \epsilon_t$$

Comparison between Gadget recruitment output time series (black line) and fitted values (grey line).

Forecast

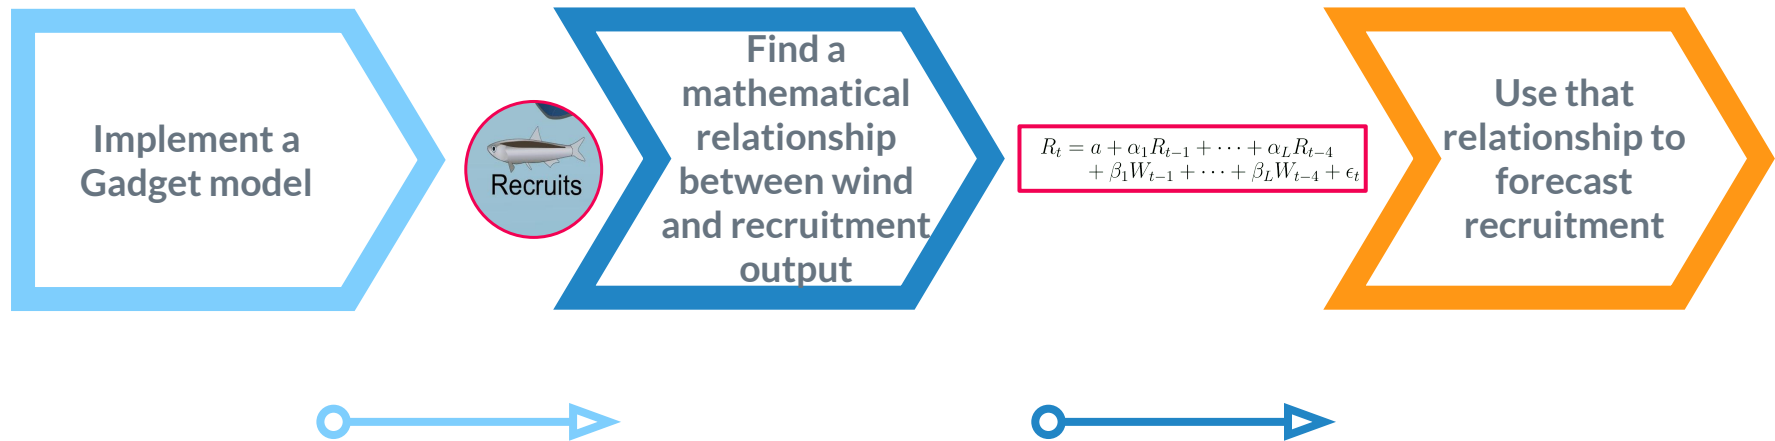

Three years forward projection with a Gadget simulation in two different wind scenarios: Good wind conditions (dark grey) and bad wind conditions (light grey).

3.

4.

CHUB MACKEREL IN MOROCCO

Chub mackerel in Moroccan Atlantic Coast

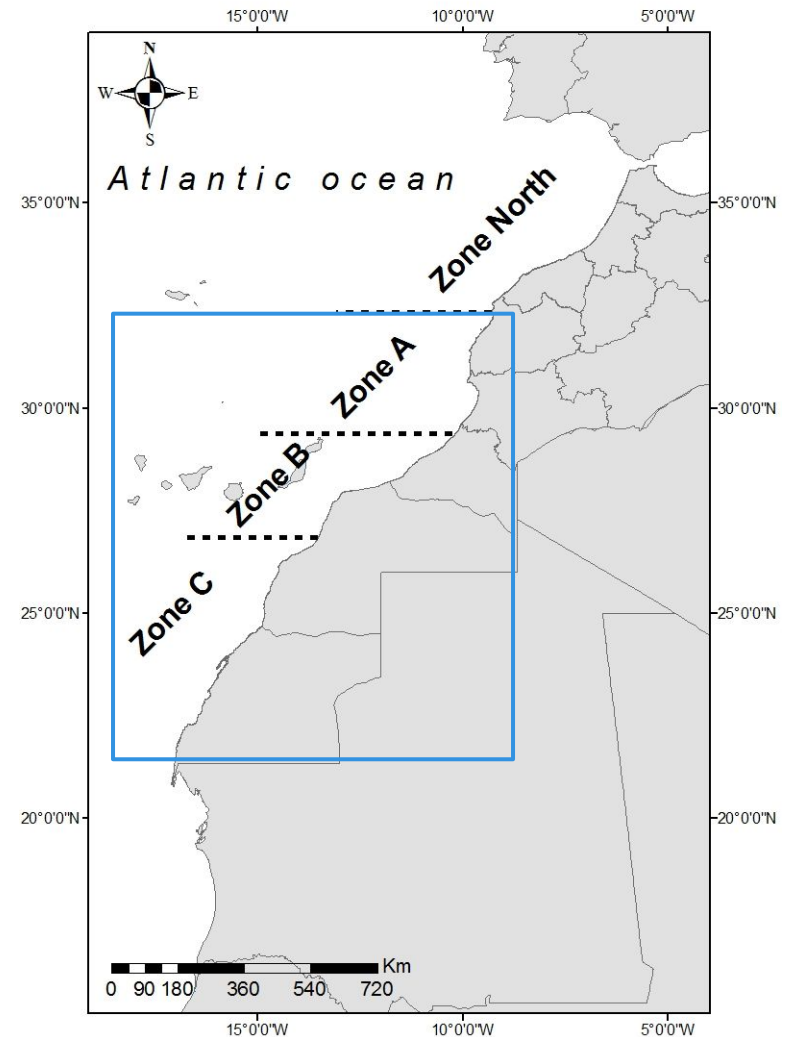

- One of the most important small pelagic fishery resources (17% of Morocco's total small pelagic stock).
- Three stocks are defined along the Moroccan Atlantic coast: **The north** (Tangier-Cap Cantin), **the center** (Cape Cantin-Cape Bojador A+B) and **The southern** stock (Cape Bojador-Cap Blanc), but **higher catches correspond to Zone A+B+C**

Data

Catches and three abundance indexes available for A+B+C Zone

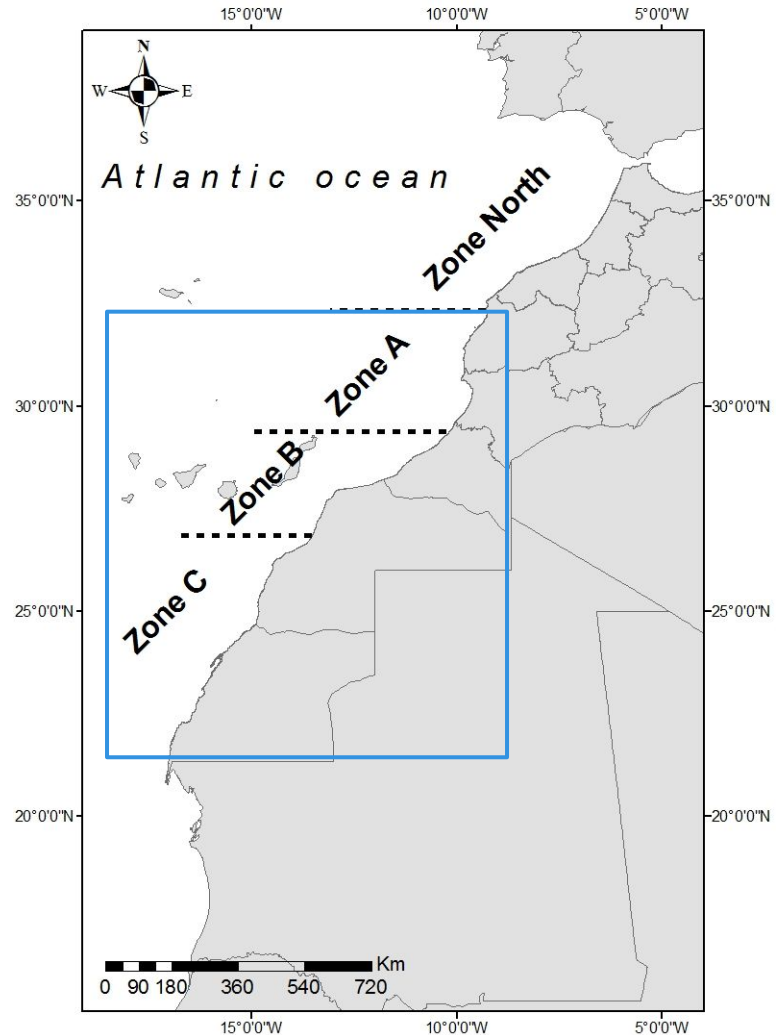

- Annual catch data from national and international fleets [1990-2018] (FAO, 2020);
- Index 1: estimated biomass from the acoustic survey by the **Amir Moulay Abdellah** vessel from 2000 to 2017 (INRH, 2017);
- Index 2: estimated biomass data from the **Nansen** survey from 1999 to 2015 (FAO, 2020);
- Index 3: estimated biomass data from 1994 to 2015. **Atlantida** acoustic survey in summer (FAO, 2020).

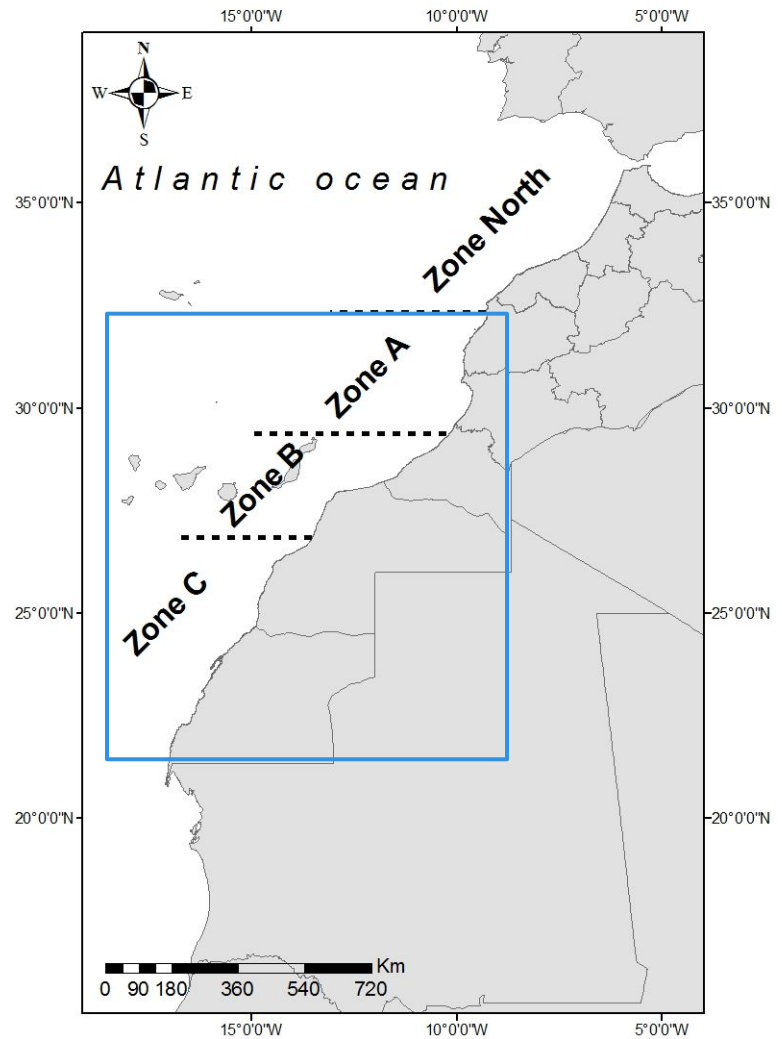

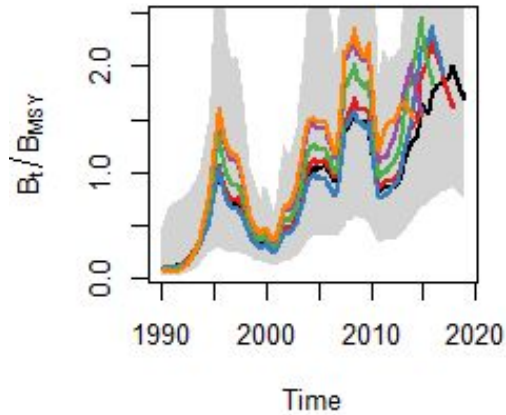

Model implementation

Surplus production in continuous time model (Pedersen and Berg, 2017) (SPiCT), A+B+C Zone

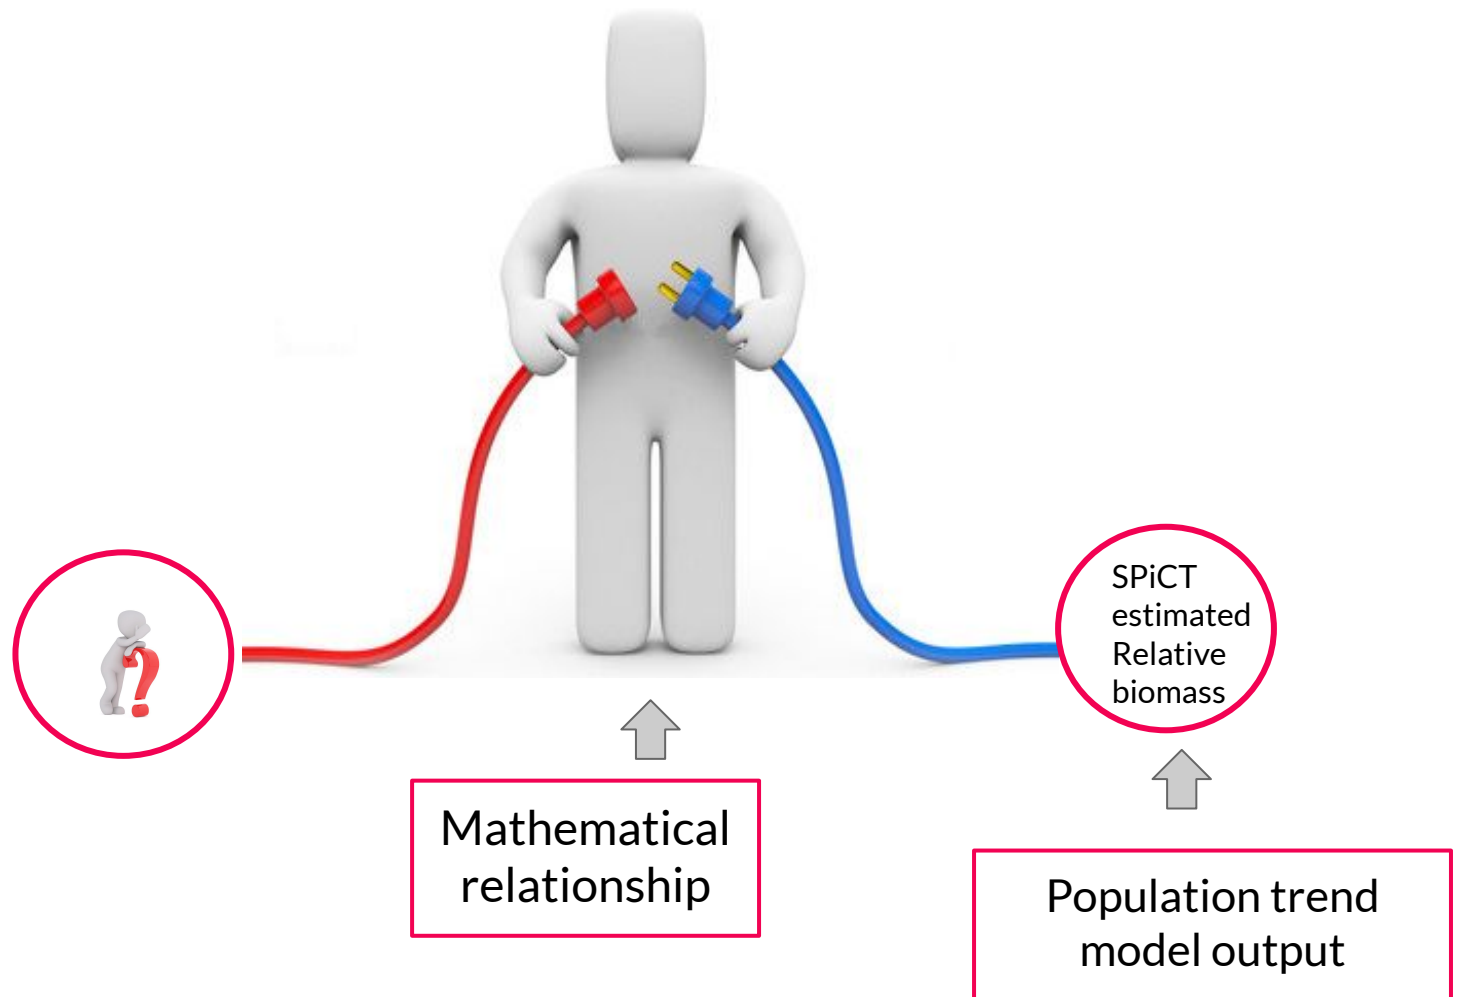

- Data input in continuous time basis (**different time steps and gaps**).
- This model can be fitted using **only abundance indices time series and catch information**.
- **Relatively easy to implement providing diagnostics on violation of assumptions and consistency.**
- Provides uncertainty estimations
- It is used for assessment of category one stocks in ICES areas

Model implementation

The model provides a **consistent trend** for population dynamics

Looking for environmental covariates

Intensive data analysis!

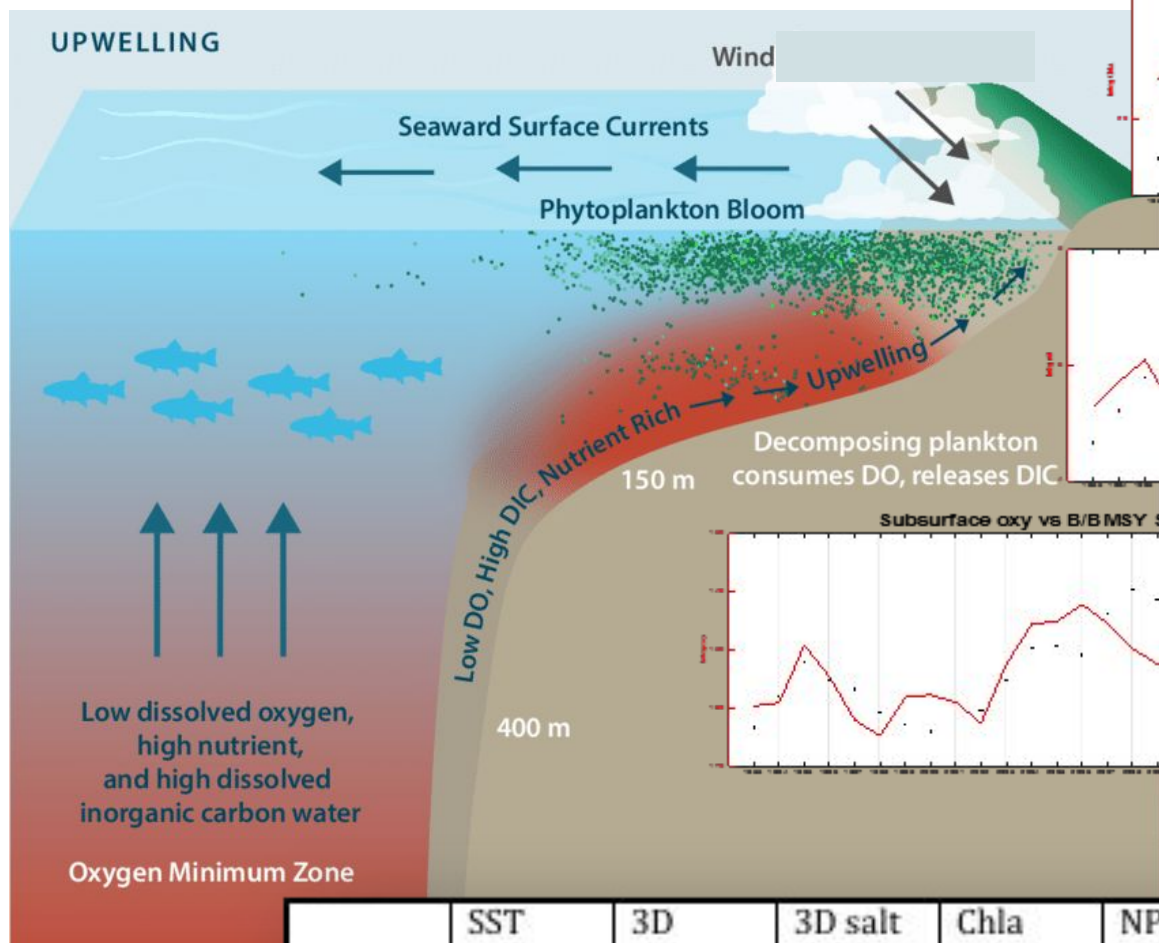

Physical conditions:

- Product: GLOBAL_REANALYSIS_PHY_001_030
- Period: 01/1993 to 06/2019
- Spatial resolution: 0.086 degrees
- Temporal resolution: monthly means
- 3D fields (surface to bottom)
- Variables:
Bottom salinity, 3D temperature, 3D salinity, 3D u velocity, 3D v velocity

Biogeochemical conditions:

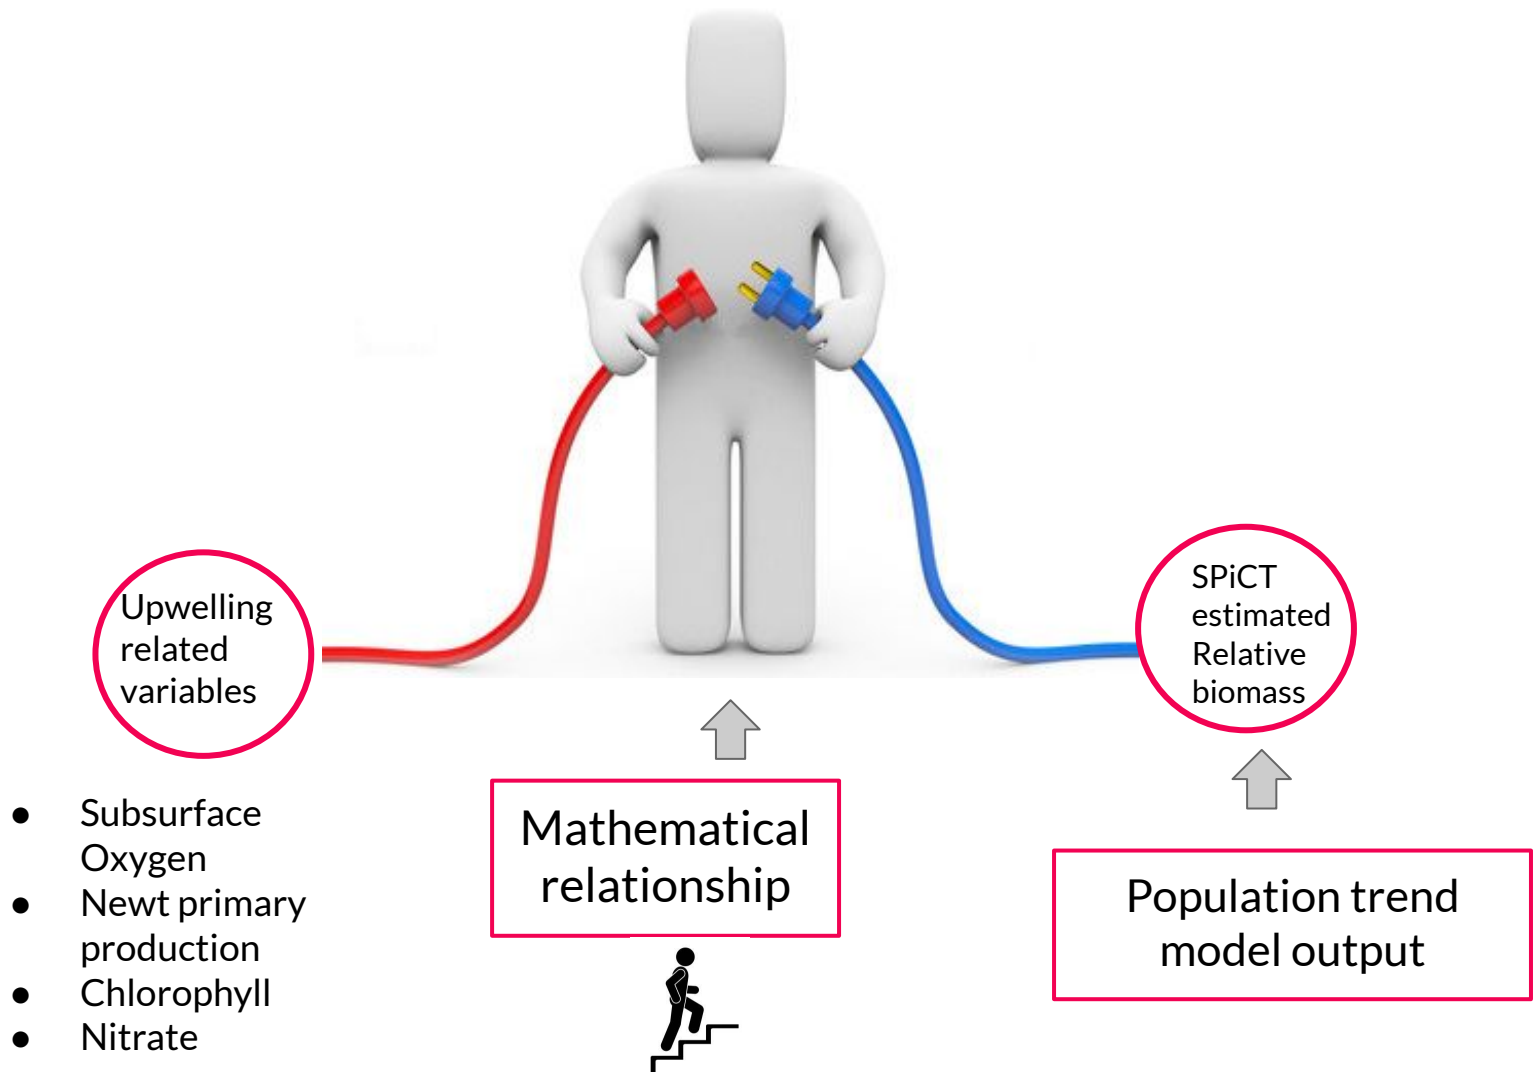

- Product: GLOBAL_REANALYSIS_BIO_001_029
- Period: 01/1993 to 06/2019
- Spatial resolution: 0.25 degrees
- Temporal resolution: monthly means
- 3D fields (surface to bottom)
- Variables:
3D Chlorophyll, 3D Net Primary production, 3D Nitrate, 3D Phosphate

From Chan et al. 2019

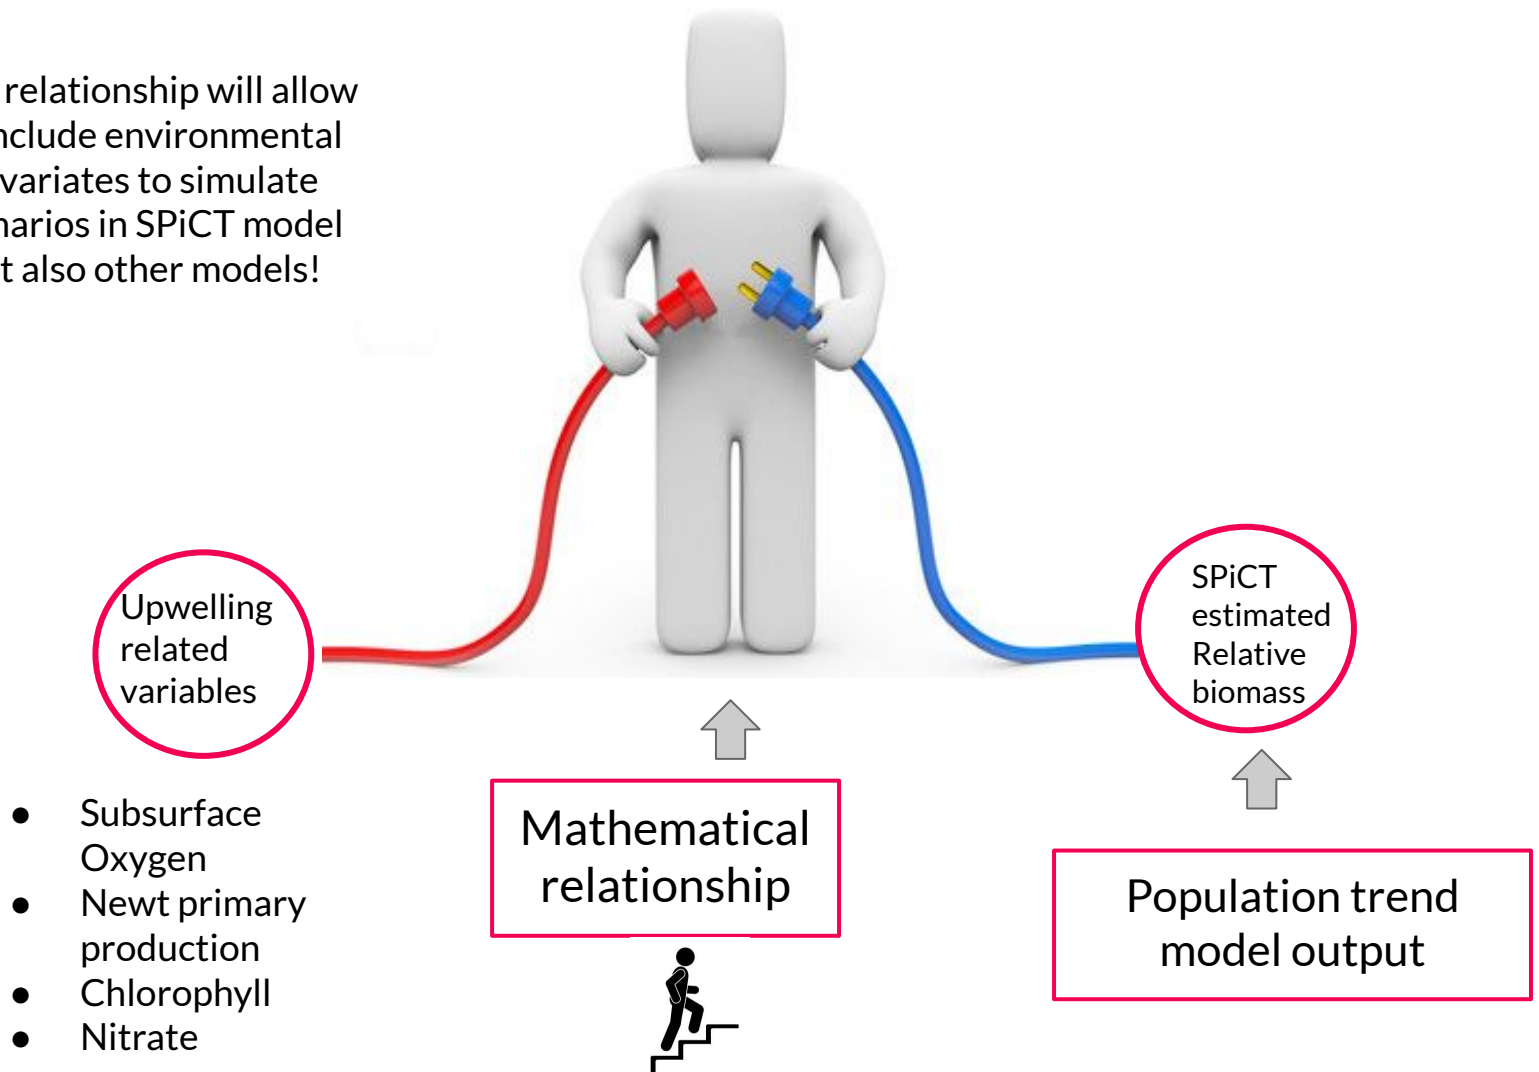

| | SST | 3D temp | 3D salt | Chla | NPP | Oxy | Nit |
|--------|----------|---------|--------------|-------------|-------------|--------------|-------------|
| Winter | -0,00014 | -0,05 | -0,49 | 0,36 | 0,34 | -0,83 | 0,69 |
| Spring | -0,06 | -0,08 | -0,32 | 0,64 | 0,56 | -0,80 | 0,68 |
| Summer | 0,27 | 0,06 | -0,16 | 0,58 | 0,48 | -0,65 | 0,56 |
| Fall | 0,31 | -0,07 | -0,42 | 0,64 | 0,44 | -0,73 | 0,69 |

One step closer to finding a mathematical relationship

One step closer to finding a mathematical relationship

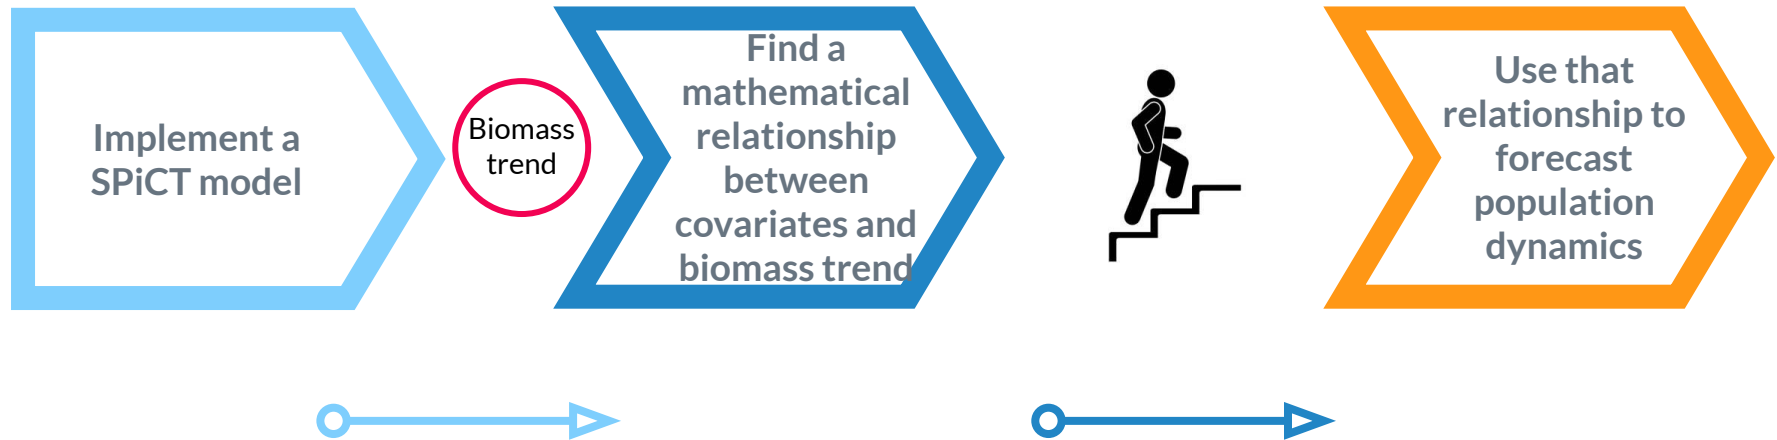

That relationship will allow to include environmental covariates to simulate scenarios in SPiCT model but also other models!

5.

SUMMARY CHUB MACKEREL

The process

- Are the data from this research available? If yes indicate where.

Anchovy: Supplementary material of Rincón et al. 2019 provides the code and data necessary to reproduce the article itself.

Article preprint open:

<https://osf.io/preprints/marxiv/zn63y/>

Supplementary material:

https://github.com/mmrinconh/Rinconetal.2019_Supplementary-material-/blob/main/Reproducible.zip

Chub Mackerel:

Data input SPiCT: FAO 2020

The rest of the data will be available when the work is finished and published (open access)

- What additional data (or analysis) would benefit this research?

Samples of age composition of catches, length composition of catches

Samples of age composition of surveys, length composition of surveys

Age-length keys for catches and surveys

- What are the implications of your findings for the CECAF area?

To provide an idea of different scenarios under different climate scenarios, for the SPiCT model and also to other stock assessment models

- What would suggest as next steps to advance knowledge on this topic?

Continue exploring mathematical relationships, implement more complicated models and more data demanding

Thanks!
